

GitHub Push Process – Step-by-Step Guide (Logistics ERP Project)

Step 1: Initialize Git Repository

In this step, we initialize a Git repository in the project folder using the command:
`git init`

This creates a hidden `.git` folder that tracks all version history. If already initialized, Git will reinitialize the repository.

Step 2: Add Files to Staging Area

Command used:
`git add .`

This command adds all project files to the staging area. In the image, you can see multiple files marked as 'A' (Added), meaning they are ready to be committed.

Message (Ctrl+Enter to commit on "...)

109

Step 3: Commit Changes

Command used:

```
git commit -m "Initial commit - Logistics ERP Project"
```

This step saves all staged files into the Git repository with a message. The output shows many files committed, confirming successful tracking.

Step 4: Additional Commits (Updates)

After making changes, repeat:

```
git add .
```

```
git commit -m "Update message"
```

This ensures version control for every update.

Step 5: Push to GitHub

Command used:

git push

This uploads all committed files to GitHub. The output confirms successful upload and branch push.

```

Conclusion

These steps ensure your Logistics ERP project is version-controlled, backed up, and ready for collaboration on GitHub.
